

### Hybrid Tr-Tone Satin Paint Protection Film

Satin Guard™, first launched in 2010, has undergone a generational upgrade in its tech. Satin Guard™ uses an advanced stage of nano-coatings that are triple layered to achieve the 3 Variants: Translucence, Satin, and Matte. Within the 3 layered coating, we infused a self-healing coating into each layer, which made the film more scratch resistant than any other product on the market. that the film's surface energy is so low that it is more scratch resistant that other products on the market.

As notably, Satin Guard's Hybrid Tri-Tone technology is further enhanced in various lighting conditions. In brighter backdrops, the translucence to satin finish is even more dramatic, which gives the vehicle a uniqueness that only Satin Guard™ can provide.

#### 3 Variances In 1

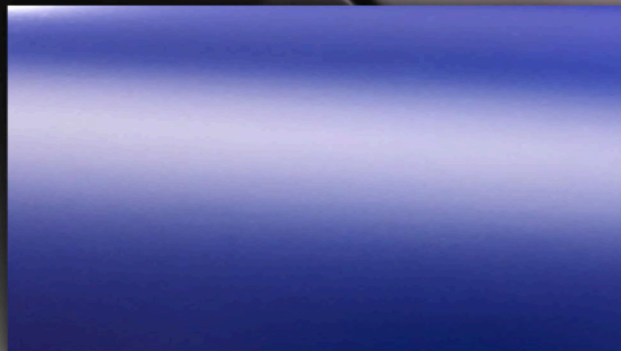

**TRANSLUCENT** - At 25 degrees, Satin Guard™ exhibits natural reflections with a translucent glow

**SATIN** - Step into 45 degrees and Satin Guard™ transitions to a satin finish

**MATTE** - Move over to 90 degrees or directly in front, then the film turns matte

#### Other Benefits

**Hydrophobic** – Our coated products enjoy the benefit of hydrophobic composition that also has a low energy surface that makes cleaning our products a cinch. With the popularity of Ceramic and high end Glass Coatings, Satin Guard's™ hydrophobic surface is designed to be compatible with such coatings for a super hydrophobic effect.

**Self-Healing** – to maintain the appearance of Satin Guard™, we made sure to have our latest self-healing coating infused to the urethane so that you may enjoy the new finish of your vehicle for years to come. Minor swirls and scratches will self-heal on its own with exposure to sunlight.

**Protection** – rated at 8.5 mils thick and an impact resistant design, Satin Guard™ will give you significantly more protection compared to vinyl and ceramic coatings alone.

#### Matte Paint?

We design our products with much R&D time. Matte paint from the factory is something we anticipated. Satin Guard™ will allow your matte paint to come through nicely without much change aesthetically. Compared to other brands, Satin Guard™ allows the true color of the paint to show through while other products will lighten and dull the color by several shades.

#### Comparison of Satin Guard™ vs. Other Brand

**Adhesion and Elasticity** – for the installer. Both elasticity and adhesion are properties we factored into Satin Guard™ to assist with ease of installation and for working compound curvatures. As an installer you will notice Satin Guard™ applies much easier compared to other films.

Being a specialty thin film manufacturer, we are capable of creating truly unique products by maintaining a robust team of talented engineers whose sole focus is to remain at the forefront of nano-science. Our industry leading product portfolio includes:

- Spectra PhotoSync® IRD
- CeraLuxe® IRD
- ClearGuard Nano SR™
